Once I upgraded to the new version of Photoshop I was actually quite encouraged with the new performance. I'm not saying that the first version of the software was perfect, what I mean is that my new version of Photoshop, with the Smart Previews feature enabled, is faster than my previous version of Photoshop CC with the Smart Preview enabled. I was cautious when I upgraded to CC for the first time, having left a recent version of Photoshop behind. Fortunately, it seems like the performance penalty isn't as bad as I expected and I'm able to work productively on minor tweaks and elemtant additions to my projects. I use Photoshop most for retouching or finishing off edited photos, so I don't go far into the more complex art-based features. I love most of Photoshop's new features, but the auto-crop feature is now so off-centered that it looks like it's supposed to be from a different application. I had to use a standard image off of the internet to check it out. I am not sure how many people will be buying this version as there will be a lot of disappointed people when they see it, I believe. I wouldn't at all say give this a pass, its great when it does what it says. It is very frustrating. I just upgraded to Photoshop CC and Performance with a high end system is slow. It takes about 3 to 4 minutes to load and then runs slow until I switch back to the main program. All my work is done in composition. I don't have any images in the library. I just use the program to pull in images and open them into the main program. Application navigation library doesn't enable. It will take time to get use figured out. If I want more tools in the image area, I'll have to reload and press the tools down below the image. Why does having 500 images in the library make a difference? I didn't have 500 images in the library. I have 500 images in the library, but no names. The images are named with their file numbers. I have to go back to what I originally imported into the program when looking up names. I hate the "Backup/Restore" feature in the main program is broken. It doesn't prompt me to restore a backup after loading a project. I would leave it to someone else to try to use the new features. I don't have time to reload and re-open...

In fact, the company is focusing on expanding three key features of the application -- Content-Aware Move, Edge Warp, and Device Compensation (for mobile devices). Content-Aware Move lets a user select an area of an image in which certain elements will be fully replaced, but the rest of the image will remain intact. It's useful for adding a logo to a photo, or making sure the person in the corresponding portrait is in the photo.

All the blending modes available in Photoshop are the point-to-point modes, while it blends the specified color from the source layer to the destination layer. There are two types of blend modes - point-to-point and point-to-rectangle. You can play around with the settings in the dialog box to achieve the optimum results. The Spot Healing Brush allows you to easily select a specific area and correct its parts. A notable exception to this is its ability to correct circular objects. It utilizes the Surround with Live Content tool, which allows you to isolate a desired area for fixing and then select the tool to add the effects. This tool can also seamlessly include various types of effects, such as healing, healing with burn, etc.
