The first step in installing Adobe Photoshop is to download and install it on your computer. From there, you'll need to locate the installation.exe file, which is usually available online. When the file is downloaded, run it on your computer, and follow the on-screen instructions to complete the installation of the software. Once the installation is complete, you'll need to crack the program. To do this, you'll need to download a crack for the version of the software you want to use. Then, after you've downloaded the crack, you need to disable all security and system safeguards. After this, you can open the crack file and follow the instructions on the screen to patch the software. Once the patching process is complete, you'll have a fully functional version of Adobe Photoshop on your computer. To make sure that the software is running properly, you should check the version number to ensure that the crack was successful. And that's it - you have now successfully installed and cracked Adobe Photoshop!

Lightroom has smart sorting capabilities. One of the nicest tools on the interface is the section that allows you to select tags and categorizes automatically. Every photograph has at least one tag, and Lightroom allows you to make those tags in bulk. Lightroom is also not limited to dSLR photos. Edge-to-edge is a good idea. It's a good way to preserve tonal range in the final image while cutting out a tiny bit of the image in the process. It works reasonably well - and is used by other photographers. If you enable this in the Edge-to-edge dialog, a new dialog will appear with a preview of the selected edge. Using this filter changes the tone curve on the fly while preserving the tonal range (aka, no data is lost). If you enable this in 'Image > Enhance > Sharpen > Details', a new dialog will appear. While in this dialog, you can drag the black marky slider and move it around the image. This changes the overall sharpness. Adobe is trying to be friendly. I use Lightroom quite often with no issues. I love the silky smooth performance, the rendering which imitates the output of your printer rather than the very bad quality you get from Bridge or Photoshop, the ability to view raw images, and many other things. This is a feature of Lightroom whose results are better than another program's because it makes more assumptions about the files than other programs do. For example it assumed a color profile for a file that was pulled from a RAW file, and also assumed that a file was in RAW format. It gave a warning if it couldn't figure out how to do either of those things.

As far as the software's capabilities are concerned, it's not below average. It's designed for users who want to create high-quality graphics files, and the feature set is generally reliable if not very robust. Image editing is a basic tool for a photo editor; however, editing text is still limited. The ideal photo editor will have text-editing capabilities, basic crop operations, and layers. Photoshop Elements is missing these features. Instead, it has a combination of simple tools like the crop tool and color-correction feature. The typical photo editing tasks in the software are simple trimming and cropping. With the tools available, it's not very difficult to edit your photos. Buying an entry-level version of Photoshop is not very costly. Q: Tap: Pushing a button in an UIViewController I want to tap a button in an UIViewController and get the message "segue completed" back in my navigation controller. If I tap the button on the main view, the view works fine, but the segue never completes. I'm locking the screen in the prepareForSegue, changing the VC, then unlocking the screen. Is there some overlap when I attempt to unlock the screen that causes it to not have released the lock? That's what I'm wondering... -(void)prepareForSegue:(UIStoryboardSegue *)segue sender:(id)sender { if (self.viewController == segue.destinationViewController) return; UINavigationController* nav = (UINavigationController*)segue.destinationViewController; if ([nav.viewControllers count] > 1) { UIViewController *pad = ((UINavigationController*)nav).topViewController; self.navigationController = nav; } } A: You'll want to write your segue to be chained to multiple destination view controllers, and use a block in your prepareForSegue to set the destination view
